New versions of the **AS range** with partial **Smart Drain** outlet, making it possible to maintain the water tank level without using the overflow pipe, but employing a drain pump which is actioned automatically and driven electronically.

Prior to starting to rinse with clean water, the **SMART DRAIN** system partially empties the water present in the tank by draining the dirtiest water from the bottom; in other words, the part containing residues that deposit by force of gravity.

In doing so, all the clean water introduced with the rinsing contributes to "regenerating" the tank water, increasing the water quality. Furthermore, it's possible to choose after how many cycles to completely empty the tank to start a totally clean water cycle.

This innovative system allows for a remarkable reduction of the quantity of detergent to be used and an increase in the cleaning efficacy of the following cycle.
